Wave Form Comparison

Pure or True Sine Wave inverters

produce AC power that is similar to power from the public utility grid system. Pure Sine Wave power operates even the most sensitive and sophisticated electronics.

Modified Sine Wave inverters

produce AC power that is sufficient to run most electronics. Some applications such as laser printer, fax machine, satellite receiver and plasma tv set may not run properly with modified sine wave power, or they may demand pure sine wave.

What inverter size do I need?

Choosing the right inverter size depends on the power requirements of the electronics you expect to operate at any given time. You should consider both the continuous and surge power rating of your electronic device or appliance. The charts above are a general guideline, consult your technician for appropriate inverter system sizing and design.

Example: If you are going to operate 2 devices at once, add up the total wattage of both devices then add at least 50% more to account for start up spikes in the power draw.

(a) Microwave 1000 W + (b) Portable Lights 200 W
Recommended size of inverter: 1000 W + 200 W + (0.50 X 1200 W) = 1800 W

NOTE: This Selector Guide is a general guideline. Most Xantrex products will operate commonly used electronics & appliances. So you should select your Xantrex product based on the total of highest wattage of each electronic device you may operate at the same time. Result may also vary depending on brands or models of the same type of electronics, which may have different power requirement. Please refer to technical specs of electronics you will operate using the inverter.

Dual 8 D	440				✓	✓	✓	*
Triple 8 D	660					✓	✓	✓

¹ Output achieved by stacking two TRUECharge2 units in parallel. Note: 10A/12V model is not equipped with parallel stacking feature.

* These charts are a general guideline, consult battery manufacturer specifications and your technician for appropriate sizing of battery charger to your battery bank/type. Mixing battery types is not recommended.

Determining your battery bank requirements

The example below will help you to determine the battery bank capacity you need to operate common appliances using a standard 12V battery system.

Appliance or product	Continuous Wattage	DC Power Consumed (Watts/10*)	Appliance Run Time	Amp Hours Consumed Between Charge Cycles	Battery Bank Required (Ah/0.50**)
	Watts	Amps	Hours	Amp-Hours	Amp-Hours
Audio System	100 W	10 A	4 Hr	40 Ah	
Coffee Maker	1200 W	120 A	1/2 Hr	60 Ah	
Microwave	1000 W	100 A	1/4 Hr	25 Ah	
	2300 W	230 A		125 Ah	250 Ah

The above scenario would result in a 12V battery bank total system requirement of 250 amp-hours.

The battery bank total amp-hours must exceed the total amp-hours required by the system for best performance & battery life.

*Dividing watts by 10 allows for easy mathematics and typical system losses

** Deep cycle batteries should only be discharged no lower than 50% State-of-Charge (SoC)

Note for 24V battery systems:

125 Ah in a 24V battery system contains equivalent energy of 250 Ah in a 12V battery system.

What type of batteries should I use?

Xantrex recommends using only high quality deep cycle batteries for inverter applications. Deep cycle batteries are designed specifically for deep discharge which results in better system performance and battery life. Do not use starting batteries for inverter applications.

Do I need to install my inverter near my batteries?

Ideally an inverter should be installed within 10 feet of the battery bank. If you increase this distance, you will need to use thicker DC cables to compensate for a drop in voltage and related lower inverter performance.
